

# IMPLAPROTECT

MAX

System for peri-implant mucositis treatment

# Elements included

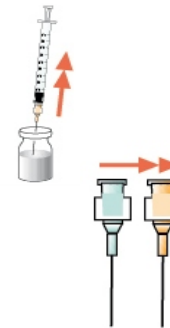

- Powder bottle: piperacilin & tazobactam
- Liquid bottle: hyaluronate acid & carrier

# Product preparation

## Mixing the powder and the liquid elements

1. Take out all the liquid from the bottle and put it in the powder bottles
2. Shake the bottle until the liquid and the powder have been completely mixed
3. Take out the necessary amount of the solution mix to apply in the wound
4. Change the syringe needle

# Application

- ✓ Extract the product from the bottle (what is expected to be used)
- ✓ To apply the solution the recommended way is to use the syringe imitating a perio probe and reaching the depths of the pocket.
- ✓ Once close to the bottom of the pocket apply the product until the pocket is almost filled up (reaching gum level).
- ✓ This process should be done all along the affected implant's areas across the circumference. One side is not enough if other sides are affected.
- ✓ After the application, patient should try to improve hygiene habits and rinse regularly
- ✓ Regular visits to monitor the evolution are recommended ( at least yearly frequency)
- ✓ Repeat the treatment as many times as necessary
- ✓ Product , once opened and mixed, will last for up to 8 weeks without losing therapeutical properties
